Teaching

My teaching includes undergraduate and graduate level courses in Organic and in the past, General Chemistry. Courses taught: Chem 1310 (General Chemistry I), Chem 2210&2220 (Organic Chemistry I&II), Chem 4297 (Organic Synthesis and Spectroscopic Analysis), Chem 6220 (Advanced Synthetic Organic Chemistry), Chem 6240 (Physical Organic Chemistry). I had also prepared lab manuals, and instructed both introductory and advanced undergraduate organic chemistry laboratory courses (Chem 2219, 2229, 4297).

Teaching evaluations resulted in 13 teaching awards from Missouri S&T.

Research (h-index: 42)

My research spans from physical organic chemistry, supramolecular chemistry to nanotechnology, synthesis of new organic materials including aerogels with applications as drug delivery systems, sensors, catalyst supports, gas adsorbers, biomimetics (shape memory materials), thermites, and more recently carbon aerogels for CO₂ capture. My research projects over the years have been funded from NIH, NSF, PRF, NASA, ARO, DOE, SBIR-Navy and industry. Research projects past and current are briefly described below:

- (a) As part of an effort to find efficient radical traps, and consequently anticarcinogenic agents, we have investigated the reaction of electrochemically generated radicals, such as superoxide and hydroperoxyl radicals with biomolecules such as vitamin A and β -carotene (as a mixture of geometrical isomers). We have also compared the rate constants of the various mono-cis isomers of β -carotene with superoxide, generated via pulse radiolysis (NIH: \$200K).
- (b) Synthesis and study of the redox chemistry of a wide range of compounds based on the 4-benzoyl-*N*-methylpyridinium cation. This project has led into establishing that class of compounds as viable electrochromic materials, and as redox mediators (i.e., catalysts) for sensors and biocatalysts. At a more fundamental level, this project has led into studies of charge percolation in dendritic systems and optical oxygen sensors with the highest dynamic range and sensitivity ever reported. Along the way, we also measured and established the sigma substituent constant (a fundamental thermodynamic quantity) of the one-electron reduced form of the nitro group, a

discovery with far reaching implications with regards to using that group in organic synthesis (PRF: \$60K).

(c) Synthesis and study of new arylethynyl substituted anthraquinones, Os(II) complexes, and substituted phenothiazinium cations as part of an effort to shift photoluminescence in the near-IR. (NASA: \$300K).

(d) Supramolecular chemistry related to shifting the keto-to-*gem* diol equilibrium to the keto form by intercalation in curcurbit[7 or 8]uril hosts.

(e) Since 2002, in collaboration with now retired Curators' Professor Nicholas Leventis, we have launched an extremely successful project on polymer crosslinked aerogels, namely X-aerogels (ARO: \$2.0 M, 3 grants since 2010; NSF: \$1.265 M, total of 6 grants), BASF (\$211K), and DOE (\$265K). We were able to resolve the fragility problem associated with this lightweight class of materials by developing crosslinking chemistry that increased the strength of silica aerogels by a factor of over 300 for a nominal increase in density by a factor of 3. We have also developed synthetic methodology for the preparation of a plethora of organic aerogels. Several patents resulted from these new aerogels. This research has attracted national and international attention: *C&E News* (09/16/2002), *BusinessWeek* (10/14/2002), *Today's Chemist at Work* (Nov. 2002), *Materials Today* (Nov. 2002), *American Way Magazine* (Jan. 2005), *Chemical Science (Chem. Sci.* **2008**, 5, C35), *Nature* (2009) and many other publications in several languages). The new aerogel nanocomposites have shown a myriad of applications ranging from catalyst supports, drug delivery systems, biomimetics to armor vests, insulated windows, automobile bumpers, gas adsorbers, thermites, etc.
